IBM Plex Sans

Aa Bb Cc 0123456789

Flat web mark. Subtle GNOME depth. Outlined logo lettering.

A clear mark, with room to breathe.

Unequal shares in a battery enclosure. A consistent baseline. Flat artwork for identity use.

Clear space

Leave 24 px around a lockup with a 96 px-high mark.
Scale that space proportionally.

Minimum digital widths

Horizontal 180 px; stacked 160 px; wordmark 140 px.
Full mark 48 px. Symbolic 16-32 px.

Preserve proportions, spacing, share order, and supplied colors. Avoid shadows and busy backgrounds.

Signal, with restraint.

Separate brand colors from action, status, and data roles. Check the specific combinations you use.

White
#FFFFFF

Slate
#60747C

Readable actions

Use deep teal #076F7C for small links and button backgrounds on light surfaces. Keep #087F8C as the brand mark color.

On dark surfaces, use cyan actions with Ink button text. Slate is muted text on white and Mist. Subtle borders are decorative, not sufficient control boundaries.

Verified text combinations

Ink on Mist	14.14:1
Slate on Mist	4.54:1
White on deep teal	5.88:1
Cyan on Ink	7.51:1
Muted text on Ink	7.36:1

Ratios apply to these token pairs. Chart categories also need labels and non-color cues where necessary.

Technical clarity. Human language.

IBM Plex Sans for web and documentation; IBM Plex Mono for commands. GNOME retains system typography.

Regular 400 / SemiBold 600

Body 16 px, secondary 14 px. Headings 32-64 px.
Prose line height around 1.55, with a maximum width
of 68 characters.

`drainscope doctor`

`drainscope report --since 24h`

**See where your battery
goes.**

Battery and energy usage by app, for the
Linux desktop.

Use the lowercase project name and sentence case.
Explain measured totals and estimated shares
separately. State hardware support and limitations.

Describe observation and diagnosis. Keep claims
grounded in the product; do not promise automatic
savings or exact per-process energy.

At home in GNOME.

A dedicated full-color icon, a small symbolic, and a distinct development-build variant.

Full-color

Compact

Small

16 px symbolic source

App icon

128 px canvas, 2 px grid, 4 px darker front profile, and y=116 bottom baseline. No external shadow. Review at 128, 64, and 32 px on Linux.

Respect the desktop

Retain libadwaita surfaces, system fonts, user-selected accent, and native controls. GTK recolors the 16 px symbolic. Real desktop context still needs Linux review.

Website direction.

Lead with the promise, a real app view when available, and a maintained installation path.

A direct product story

Explain apps and terminal workloads, local history, and GNOME/CLI access. Add genuine screenshots from Linux before the public website launch.

Built from shared tokens

Use self-hosted fonts, responsive layouts, accessible actions, visible focus, and reduced motion. The included HTML is a layout study, not a published site.

Documentation direction.

Readable prose, explicit commands, and concrete explanations of measurement limits.

Measured totals, estimated shares

Use callouts to explain a specific limitation or next action.
Keep support and validation notes visible.

A useful information structure

Installation, hardware support, attribution, validation,
troubleshooting, CLI reference, and contribution guidance.

Maintain the identity with the project.

Sources, exports, tokens, templates, licensing, and a focused Linux handoff.

Ready assets

Outlined SVG logo variants and transparent PNGs.

GNOME app, symbolic, and development icons.

Favicons, touch icons, and web app icons.

README header and light/dark social cards.

Screenshot frame and release copy template.

JSON/CSS tokens and bundled Plex fonts.

Reproduce and integrate

`source/build.py` generates vectors. `source/render.cjs` generates rasters and the manifest. `source/check.py` verifies the specified geometry and color pairs.

The app and symbolic icons ship from `data/app/icons` under the stable app ID; CI keeps them identical to `exports/app-icon`. Regenerate here, then copy both icons there.

Next: real product screenshots, then the `website/docs` build and destination-specific listing assets.

Font licenses are included. A separate public license for original brand artwork has not been selected. Full references and exact rules are in `guidelines.md`.
